- Topic: Ethics

Cyber Exploitation & Ethical Boundaries

Understanding the Duality of Penetration Testing

Technical Power vs Legal & Moral Responsibility

Penetration testers use the same tools as attackers

The difference is consent and legality

The professional line is defined by contracts

Finding Vulnerabilities

- Vulnerabilities are discovered during enumeration
- Identification is only half the job
- Exploitation tests whether the flaw can be used
- Three key components must align
 - Vulnerability - the flaw
 - Exploit - the tool
 - Payload - the action

Legal Boundaries

- All hacking is illegal by default
 - Only legal with explicit consent
 - Contracts define scope and permission
 - Rules of Engagement protect both parties

Five Ethical Principles

- Beneficence – act for good
- Non-maleficence – avoid harm
- Autonomy – respect user choice
- Justice – promote fairness
- Explicability – ensure transparency

Responsible Disclosure

Discover vulnerability

Privately notify vendor

Vendor verifies

Patch is created

Public disclosure with fix

The Risk-Ethics Connection

- Risk changes over time
- Exploit availability increases danger
- Fixes reduce danger
- Ethical obligations must evolve with risk

Final Thought

Technical mastery is powerful

- Without ethics and consent it becomes criminal

- Professional responsibility is dynamic and continuous

Things that were new to me

What I already knew and confirmed.

- Social engineering is any act that influences a person to take an action that may or may not be in his or her best interests

Things I believed I understood but were wrong

- Thanks

Things I thought that you knew but were proven wrong
